GLADIOLI

Page 1

SUNBEAM FARM - EDWIN M. GEROULD - BEACH BLUFF, MASS.

DRAWINGS BY EDWIN M. GEROULD
TYPOGRAPHY AND PRESSWORK BY THE NICHOLS PRESS
LYNN, MASS., U. S. A.

ORIGIN OF THE DAHLIA

THE DAHLIA is a native of Mexico, where it grew wild, and in its single state. Earliest history dates back to 1657, when it was called Acotli by the Aztec Indians. Later the name was changed to Georgiana, after Professor Georgi of St. Petersburg, which name is still used in some of the foreign catalogues. It was again changed to Dahlia, in honor of Dr. Andrew Dahl, a Swedish botanist.

The Dahlia was first cultivated in the Botanic Gardens, at Madrid, Spain, in 1789, and at about the same time was introduced into England by the Marchioness of Bute.

Dahlia Variabilis, from which most of the common or Show Dahlias have originated, was single in its wild state. The first double forms appeared in 1814 and were credited to M. Donkelaar, of the Botanical Gardens of Belgium. The Pompon form appeared about 1858, followed then by the Decorative, the origin of which is not clearly defined, but probably dates back some 40 or 50 years. Dahlia Jaurezi, the first of Cactus Dahlia, was discovered in Juxphaur, Mexico, in 1872, by J. T. Vanderberg, and named Jaurezi in honor of President Jarez of Mexico. It was sent by Vanderberg to an English florist, who exhibited it in England in 1880.

Dahlia tubers or bulbs were used as a food in Mexico, and at one time in France. It was attempted to introduce them into cultivation in all Europe as a food for either man or cattle, but the taste was found distasteful to European palates.

Sunbeam Dahlias

SUGGESTIONS FOR CULTURE

THE DAHLIA will grow in any soil that will produce corn or potatoes, but will do best in ground that is rather light, well drained and moderately rich, away from shade of trees or buildings. The ground should be well manured and plowed or spaded to a depth of eight or ten inches.

Before planting drive stakes for the plant to avoid injury to the tuber, upon which the plants may be tied. Dahlias should be planted about three feet apart.

Dig the hole about six inches deep, lay the tuber on its side with the eye upward, then cover with three inches of soil. When the plant grows above the ground, fill the hole even with the surface; as soon as the plant is large enough, pinch off the tops just above the second or third set of leaves, causing the plant to branch before budding. The ground should be well worked during the growing season. Watering is most essential in producing perfect blooms on your dahlias. In hot, dry weather, they should be given a great

Madonnas of the Soil

deal of water, and, in order to hold the moisture around the roots, it is well to mulch plants either with dry leaves or with any fibrous material.

After the frost has killed the foliage, cut off the stalks with a saw about six inches from the ground. Lift the clumps carefully with a fork, turning them upside down in order to drain off all superfluous water, allow them to dry in the air, thus preventing decay. If decay should start, cut away all rotted parts, and with a little powdered sulphur cut or sprinkle the parts affected. Be sure and look over your tubers several times during the winter. Tubers should be stored in a place free from frost. If in an old-styled cellar without cemented bottom or without heat, covering is not necessary, but if cemented and heated they should be covered with papers or burlaps to keep the air from them thus preventing shriveling. It is a very good idea to pack the tubers in dry sand, sawdust or any other similar material. Some success has been obtained by wrapping them in newspapers and packing them away in a barrel.

We are always pleased to answer any questions regarding dahlia culture.

Sunbeam Dahlias
